Modules Overview

Full Documentation ⊙

prime

The function to create new primes.

```
var prime = require("prime")

var Animal = prime({
    say: function(){
        return "!!"
    }
})

var Cat = prime({
    inherits: Animal,
    say: function(){
        return "meaow" + Cat.parent.say.call(this)
    }
})
```

prime/shell

The base shell. As you require more shells, the base shell will be augmented. Requiring specific shells gives you access to generic methods as well.

```
var array = require("prime/shell/array")

array.indexOf([1,2,3], 3) // 3

var _ = require("prime/shell")

_([1,2,3]).remove(1).each(function(number){
    console.log(number)
})
```
